Low Adoption of Renewable Energy

What is it about?

Renewable energy comes from sources that naturally replenish — sunlight, wind, water, geothermal heat and biomass. Unlike coal, oil and gas, they produce little to no greenhouse emissions.

Despite clear benefits, adoption remains low in many regions. High upfront costs, weak infrastructure, policy gaps, and dependence on established fossil-fuel systems slow the transition.

This presentation examines the barriers to renewable energy adoption and why speeding it up matters for a sustainable future.

SDG 7 - Affordable and Clean Energy

Why this SDG matters here

SDG 7 aims to ensure access to affordable, reliable, sustainable and modern energy for all by 2030. Low renewable adoption is the core obstacle to reaching it.

Every barrier to clean energy — cost, infrastructure, policy — directly slows progress on this goal, keeping communities dependent on polluting, finite fuels

Solutions

1. Grid Modernization & Energy Storage
2. SolarShare - A Community Solar Investment and Virtual Net-Metering Platform
3. Solar Impact & Rewards Tracker (SIRT) – A Gamified Web Platform for Rooftop Solar Adoption and Savings Tracking
4. Renewable Energy Suitability & Site Assessment tool
5. Renewable Energy Adoption Barrier Advisor
6. AI Powered Community Solar & P2P

Grid Modernization & Energy Storage

Making the grid ready for clean power

Upgrades ageing grids with smart controls and large-scale battery storage so variable solar and wind supply can be absorbed, balanced and delivered reliably.

- Smart grid controls handle fluctuating renewable supply
- Battery storage shifts surplus energy to peak demand hours
- Reduces blackouts and curtailment of clean energy

SolarShare - Community Solar Investment Platform

Virtual net-metering for everyone

Lets people who can't install panels buy a share in a shared solar farm and earn bill credits through virtual net-metering — lowering the upfront cost barrier.

- Invest in solar without owning a rooftop
- Earn credits on electricity bills via virtual net-metering
- Opens clean energy to renters and apartment dwellers

Solar Impact & Rewards Tracker (SIRT)

Gamified rooftop solar adoption

A web platform that turns rooftop solar into a rewarding experience — tracking savings and CO2 impact while using points, badges and leaderboards to drive adoption.

- Real-time savings and CO2 impact dashboard
- Points, badges and leaderboards motivate uptake
- Turns abstract benefits into visible, shareable wins

Renewable Energy Suitability & Site Assessment Tool

Know before you install

Assesses a location's solar or wind potential using site data — roof angle, shading, sunlight and space — so users get an accurate feasibility report before investing.

- Evaluates solar/wind potential for any site
- Factors in shading, orientation and available space
- Removes guesswork and reduces failed installations

Renewable Energy Adoption Barrier Advisor

Guidance past the roadblocks

An advisory tool that identifies the specific barriers a user faces — cost, policy, awareness — and recommends tailored subsidies, financing and next steps.

- Diagnoses each user's adoption barriers
- Recommends relevant subsidies and financing options
- Delivers a personalised, actionable roadmap

AI-Powered Community Solar & P2P Energy

Guidance past the roadblocks

An advisory tool that identifies the specific barriers a user faces — cost, policy, awareness — and recommends tailored subsidies, financing and next steps.

- Diagnoses each user's adoption barriers
- Recommends relevant subsidies and financing options
- Delivers a personalised, actionable roadmap

Why We Chose SolarShare

Of all six solutions, SolarShare removes the single biggest barrier to adoption cost while reaching the widest group of people.

Attacks the #1 barrier
It directly targets high upfront cost the main reason people don't go solar. No panels, wiring or rooftop investment needed.

Strongest SDG 7 fit
Its whole purpose is affordable, accessible clean energy for all the exact aim of SDG 7.

Scalable & low risk
One community farm serves many members, spreading cost and risk while growing clean-energy capacity fast.

Democratizing Clean Solar Energy for Everyone

Bridging the gap for renters, flat owners, and shaded-roof residents through fractional community solar investment.

Explore Shared Sites

The Environmental Problem

Low Adoption of Renewable Energy[cite: 1]: Despite falling equipment costs and supportive schemes like PM Surya Ghar and ANERT Soura, voluntary rooftop solar adoption remains severely bottlenecked.

The primary driver is **Structural Exclusion**:

- Urban renters and tenants lack property alteration rights.
- Apartment dwellers lack individual terrace ownership.
- Shaded or structurally weak roof owners cannot host systems

Target Users & Alignment

Target User Demographics:

- Apartment & Flat Residents (e.g., Residents Welfare Associations).
- Tenants and Urban Renters seeking green energy offsets.
- Institutional clusters & households with unsuited roof structures.

Sustainability Alignment (SDG 7, 11, 13):

By enabling group investments, SolarShare directly aligns with **SDG 7 (Affordable and Clean Energy)**[cite: 1] and **SDG 13 (Climate Action)** by replacing coal-heavy grid energy with localized, clean
